

## Incretin Mimetics

(Diabetes Medication)

Incretin Mimetics work by regulating incretin production in patients with diabetes (lowering their blood sugar) and are also prescribed to assist in weight loss. Incretins are a type of hormone which help release insulin in the body. These include certain diabetes and weight loss drugs such as Byetta, Saxenda, Komb, Janumet, Juvisync, Onglyza, Bydureon, Victoza, Janumet XR, and Januvia.

### What You Should Know

While this process lowers patients' blood glucose levels, it may do so at the expense of their pancreas. It overstimulates the pancreas causing serious side effects like pancreatitis and pancreatic cancer. These drugs are commonly prescribed and are putting millions of Americans at risk.

### Can I make a claim against the manufacturers of Incretin Mimetics?

Showard Law Firm is currently accepting these types of claims.
